

CARGO & STORAGE TANKS

Offshore  Onshore

We always challenge the market to provide our customers the best economic, practicable and reliable solution they need.

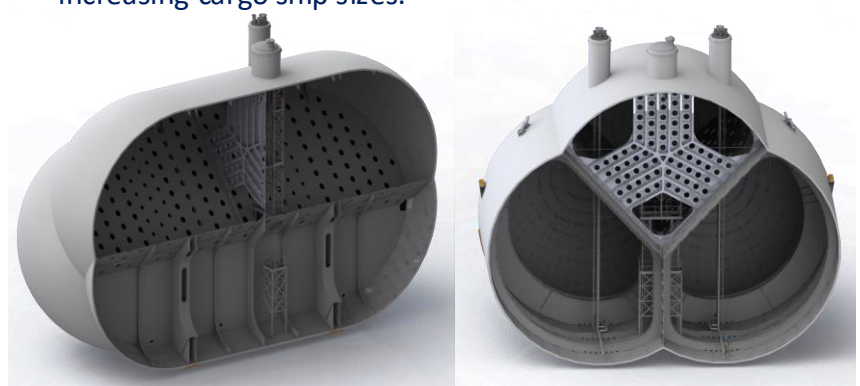

This leads for e.g. cryogenic transport solutions from already known bi-lobe tanks to new systems like Star Trilobe Tank™. Therefore, we are building the biggest type c tanks to set new standards in transportation of cryogenic liquids in a constantly more and more challenging market. The Star Trilobe Tanks™ have a lot of benefits for integration in ships, like reducing centre of gravity or its compact design compared storage volume to tank sizes.

We supply approved tanks for on- & and offshore applications, accompany and support our customers through the certification process. All to provide our partners the best solution they need. We transfer the safe and practicable solution of IMO type C tanks from offshore to onshore applications to create new advantages for our customers. This leads to a flexible storage system, quick in building, increased portability and not directly connected to origin location.

- Having the possibility of unloading and storing of cryogenic liquids at higher pressures than currently possible, creates advantages in:
- reducing running cost because less heat flux due to higher temperature,
- negotiations accepting cargoes for lower prices
- guarantees a trouble-free running of a terminal by accepting a wide range of liquid
- etc.

The big size of the tanks reduces cost, onshore installation space and still gives the opportunity to deal with increasing cargo ship sizes.

...we serve for your safety!
